## FOREWORD

The publication presents annual estimates of the System of National Accounts (SNA).

The System of National Accounts of the Republic of Belarus builds on the methodology jointly adopted by the UN, IMF, the World Bank, OECD and Eurostat as the international standard in 2008 (SNA 2008). The SNA provides data about the structure of and developments in the economy using a set of integrated accounts, tables and indicators. The accounts of the System reflect economic transactions between institutional units within each economic activity in terms of the production of goods and services, generation and distribution of income, consumption of goods and services, and capital formation.

The accounts data are compiled for the country as a whole and by sectors. The production account and the generation of income account are broken down by economic activity. The production account data for 2014 – 2019 are shown by economic activity at current and constant prices. The discrepancy between the total gross domestic product (GDP) and the sum of its components, as well as between the GDP components and the sum of their elements at constant prices can be explained by changes in the structure of weights used for the computation of individual links of indices.

The publication provides annual estimates of the gross regional product (GRP) of the Republic of Belarus.

The list of economic activities complies with the national classification of the Republic of Belarus OKRB 005-2011 “*Kinds of Economic Activity*” (OKED); institutional units are grouped by sectors in accordance with the statistical classification CK 00.007-2015 “*Institutional Units by Sectors of Economy*” (KIES); household expenditures are estimated on the basis the *Classification of Individual Consumption by Purpose (COICOP)*; general government expenditure is compiled according to the *Classification of the Functions of Government (COFOG)*.

The published data are based on official statistical information, administrative data of the Ministry of Finance of the Republic of Belarus on budget execution, of the National Bank of the Republic of Belarus on the Balance of Payments compiled on the basis of the 6<sup>th</sup> edition of the Balance of Payments Manual, other administrative sources and expert estimates. According to the Statistical Work Programme of the National Statistical Committee of the Republic of Belarus, the publication presents the results of the second annual GDP and GRP estimate.

### Explanation of symbols:

–	not applicable	thsd	thousand
0.0	negligible magnitude	mln	million
x	table layout makes entry impossible or meaningless	bn	billion
		BYR/BYN	belarusian ruble

Value indicators for 2016 – 2019 are provided in terms of the denomination effective as from 1 July 2016 (1 BYN = 10 000 BYR), for other years – in the denomination of corresponding years.

Relative indicators are calculated using absolute figures with a smaller unit of measure than those presented in the tables.

In certain cases insignificant discrepancy between the total and the sum of its components is explained by data rounding.

---

## METHODOLOGICAL PROVISIONS

### General principles

The economy of a country in general is defined in terms of institutional units. It includes all the institutional units which are resident in the economic territory of a country.

Residents are institutional units that engage, or intend to engage, in economic activities in the economic territory of the Republic of Belarus over a long period of time (for at least one year).

Resident units engage in transactions with non-resident units (that is, units which are residents of other economies). These transactions are external transactions of the economy and are grouped in the rest of the world account.

Economic territory of a country is the area under administrative control of the government of the given country within which persons, goods and capital can move freely; it does not include territorial enclaves of other countries (embassies, military bases, etc.) or international organizations, but includes its exclaves located in other territories.

The System of National Accounts (SNA) is a system of interconnected indicators used to describe and analyse macroeconomic processes.

The key indicator of the SNA is the gross domestic product (GDP) which characterises the total value of goods and services produced in the economy by all economic activities and intended for final consumption, accumulation and net exports.

GDP can be calculated using three approaches: the production approach, the expenditure approach, and the income approach.

GDP by production approach is calculated as the sum of gross values added (GVA) by economic activity and net taxes on products.

GDP by expenditure approach represents the total final consumption expenditure of households, general government and non-profit institutions serving households (NPISHs), gross capital formation and net exports of goods and services.

GDP by income approach reflects distributive transactions directly related to the production of goods and services (compensation of employees, taxes on production and imports less subsidies) the balancing item of which is gross operating surplus and gross mixed income. This item is defined as the difference between GDP calculated with the production method, compensation of employees and net taxes on production and imports.

The SNA accounts are constructed on a double-entry basis, i.e. receivables are recorded as resources, while payables are entered as uses. The difference between resources and their uses constitutes the balancing item which is shown on the resources side of the next account.

## Brief description of accounts

The goods and services account is the account of the system of national accounts that records the total supply of goods and services in the economy as well as their uses.

On the resources side, the output of goods and services, imports of goods and services, taxes on products less subsidies on products are reflected.

The use side consists of intermediate consumption, final consumption expenditure, gross fixed capital formation, changes in inventories, and exports of goods and services.

There is no balancing item in this account, i.e. resources here are equal to their uses.

The production account is the account of the system of national accounts that records transactions directly linked to the production of goods and services.

Under resources, the output of goods and services and taxes on products less subsidies on products are recorded.

Under use, intermediate consumption of goods and services is reflected.

The balancing item is the gross value added.

At the level of the total economy, the balancing item of the production account is GDP which characterizes the final result of production activity of the resident institutional units.

The generation of income account is the account of the system of national accounts that records distributive transactions which are directly linked to the production of goods and services.

The resources show the gross value added (GDP at the level of the total economy).

The uses reflect such expenditures of producers out of the value added as compensation of employees and taxes on production and imports less subsidies on production and imports.

The balancing item here is gross operating surplus and gross mixed income.

The allocation of primary income account is the account of the system of national accounts that shows how primary income received from the production activities and property is distributed between institutional units or sectors of the economy and the rest of the world.

The resources of the account reflect compensation of employees, gross operating surplus and gross mixed income, taxes on production and imports less subsidies on production and imports, and property income receivable.

The uses consist of the property income payable.

The balancing item here is the balance of primary income.

At the level of the total economy the resources of this account consist of GDP and property income receivable from the rest of the world, while uses reflect only property income payable to the rest of the world. The balancing item here is the balance of primary income of the total economy which is called gross national income (GNI).

The secondary distribution of income account is the account of the system of national accounts that reflects the distribution of income and shows how the balance of primary income of an institutional unit or sector transforms into disposable income through current transfers, other than social transfers in kind, receivable and payable.

Resources here show the gross national income and current transfers receivable.

The uses show current transfers payable.

The balancing item here is the gross disposable income.

The redistribution of income in kind account is the account of the system of national accounts that reflects the redistribution of income and shows how disposable income of households, NPISHs and general government transforms into their adjusted disposable income taking into account social transfers in kind receivable and payable.

The resources show the gross disposable income of the institutional sectors and social transfers in kind receivable by the household sector.

The uses show social transfers in kind payable to the household sector.

The balancing item is the gross adjusted disposable income.

The use of gross disposable income account shows how the sectors of households, of general government and of NPISHs distribute their gross disposable income between final consumption expenditure and gross saving.

The gross disposable income is recorded under resources.

The uses show final consumption expenditure.

The balancing item of the account is gross saving. It represents that part of gross disposable income that is not spent on final consumption of goods and services.

Gross saving may have a positive or a negative value depending on whether disposable income exceeds final consumption expenditure or vice versa.

The use of adjusted disposable income account is the account of the system of national accounts that shows how gross adjusted disposable income is distributed between actual final consumption and gross saving in household, general government and NPISH sectors.

Gross adjusted disposable income is recorded under resources.

Actual final consumption is recorded under uses.

The balancing item of the account is gross saving. It is identical to the same item in the use of gross disposable income account.

The capital account is the account of the system of national accounts that reflects the value of non-financial assets acquired or disposed of by resident institutional units as a result of transactions and shows changes in the net capital (acquisition less disposal) through saving and capital transfers.

The main source of financing of capital transactions is gross saving. Another source of funding of these transactions is capital transfers receivable less capital transfers payable.

The balancing item of the account is net lending (+) or net borrowing (-).

The rest of the world account is the account of the system of national accounts that reflects all transactions between the institutional units of an economy (residents) and institutional units of other economies (non-residents) that took place during a reference period.

The rest of the world account covers the activities of non-residents in so far as they relate to their interaction with residents. Transactions between residents and non-residents are also reflected in the domestic economy accounts, but there they are not distinguished from the transactions between residents.

The rest of the world account includes the following external accounts:

- the external account of goods and services;
- the external account of primary income and current transfers;
- the external capital account

The feature of the external accounts is that the resources and uses are shown from the perspective of the rest of the world, i.e. of other economies.

### Brief explanation of the accounts aggregates

Capital transfers are transactions where an institutional unit transfers gratis assets, in cash or in kind, to another unit, normally for investment purposes. Capital transfers are usually non-recurrent and considerable in value transactions connected with acquisition or disposal of assets. They include taxes on capital, investment subsidies, and other capital transfers.

Changes in inventories is the difference between closing stocks and opening stocks valued at average market prices of the period in question in order to eliminate price effects. Includes changes in the value of productive stocks, work-in-progress, finished products and goods, and state material reserves.

Compensation of employees covers wages and salaries and social insurance contributions. It is recorded as gross amounts, i.e. before taxes and other deductions in compliance with the legislation of the Republic of Belarus, and reflects the compensation of all employees of resident organizations, regardless of whether these employees are residents or non-residents.

Current transfers include the following major types: taxes on income, on property, and other tax revenue; social insurance contributions, state social insurance benefits, and other current transfers.

Final consumption expenditure consists of final consumption expenditure of households, of general government on individual goods and services and collective services, and also of non-profit institutions serving households. Such grouping shows which sector pays for final consumption.

Final consumption expenditure of non-profit institutions serving households is expenditure incurred by public organizations on consumption goods and services to be provided to households free of charge, including health care, education and cultural services provided by employers to their employees.

General government final consumption expenditure on collective services consists of expenditure incurred from the budget on services that meet the needs not of individual households, but of the society as a whole or of selected population groups (defence, public administration, roads, etc.).

General government final consumption expenditure on individual goods and services consists of expenditure incurred by general government on consumption goods and services intended for individual consumption and financed from the budget.

Gross disposable income is defined as income left at the disposal of resident units for final consumption and gross saving. It is equal to the sum of gross national income and current transfers receivable less income payable as current transfers.

Gross domestic product is the value of goods and services produced in an economy by all economic activities and intended for final consumption, capital formation and net exports.

Gross fixed capital formation is defined as resident units' investment in fixed capital with the purpose of using it in production to generate new income in future.

Gross national income (GNI) is the total primary income receivable by resident units plus the balance of primary income receivable from the rest of the world. The difference between GNI and GDP is equal to the primary income receivable from the rest of the world less primary income payable to the rest of the world.

Gross operating surplus is the part of gross value added which remains with producers after deducting the outlays related to the compensation of employees and taxpaying.

The surplus generated as a result of production activities of household unincorporated enterprises is referred to as gross mixed income because it includes the component of labour remuneration which is inseparable from the owner's income.

Gross regional product (GRP) is the value of goods and services produced in a region by all economic activities and intended for final consumption, capital formation and net exports.

When summed up, the GRPs of regions differ from GDP by the share not distributed by regions (further referred to as unallocated share), taking into account the absence of information at the regional level which is available at the national level only.

Gross saving is the part of gross disposable income which has not been spent on final consumption of goods and services.

Gross value added (GVA) is the output of goods and/or services less intermediate consumption, calculated by economic activities.

Household final consumption expenditure consists of expenditure incurred by households on individual consumption goods and services. Household final consumption expenditure consists of expenditure on purchases of (consumption) goods and services, expenditure on final consumption of goods from income received in kind (other than social transfers in kind), and expenditure on consumption of goods and services produced by households for own final consumption.

Intermediate consumption is the value of goods and services consumed in the process of production over the reference period. The intermediate consumption does not include the consumption of fixed capital.

Kind of economic activity is a process where material resources, equipment, labour, and technology are combined in such a way that this results in the production of a homogeneous set of products (goods or services).

Labour productivity is a measure of effectiveness of production which characterizes the output or the gross value added per unit of labour. For the total economy, it is calculated as a ratio of GDP (GVA) to the number of employed in the economy. To show the dynamics, the labour productivity index is calculated as a ratio of the volume index of GDP (GVA) to the index of employed population.

Net exports of goods and services is the value of exports of goods and services less the value of imports of goods and services; it measures the turnover of Belarus with the rest of the world, including the CIS countries.

Net lending (+) or net borrowing (-) is the difference between the changes in net capital as a result of saving and capital transfers and net acquisition of non-financial assets (acquisition of non-financial assets less disposal, less consumption of fixed capital). A negative value represents net borrowing. It shows the value of resources that can be lent or need to be borrowed. At the level of the economy, net lending or net borrowing show the value of resources payable to the rest of the world or receivable from the rest of the world.

Net taxes on products are taxes on products less subsidies on products.

Non-observed economy is a part of the national economy which includes the production, circulation and use of goods and services not covered (or not fully covered) by state statistical surveys and represents hidden, informal and illegal economic activities.

Other taxes on production are taxes related to the use of production factors (land, assets and labour force) as well as the state duty for granting a special permission (license) to carry out

selected economic activities, or other compulsory payments required to carry out resident's economic activity.

Output of goods and/or services is the total value of goods and/or services which are the result of economic activities of residents in a reference period.

Production sector consists of the following economic activities: agriculture, forestry and fishery; mining and quarrying; manufacturing; electricity, gas, steam, hot water and air conditioning supply; water supply; waste management and remediation activities; and construction.

Property income is income receivable by institutional units from putting the financial assets and non-financial non-produced assets at the disposal of other units (income from property lease, selling licenses, using natural resources, acquired goodwill).

Service sector consists of wholesale and retail trade; repair of motor vehicles and motorcycles; transportation, storage, postal and courier activities; accommodation and food service activities; information and communications; financial and insurance activities; real estate activities; professional, scientific and technical activities; administrative and support service activities; public administration; education, health and social work activities; arts, sports, entertainment and recreation; and other service activities.

Subsidies are current unrequited payments from the budget to organizations provided these organizations produce particular goods or services.

Subsidies on products are subsidies given for a unit of a good produced or service provided, that is proportionally to the quantity or value of goods and services produced and sold or imported by resident units.

Taxes on products are taxes payable proportionally to the quantity or value of goods and services produced and sold or imported by resident units. Taxes on products include the value added tax (VAT), excise taxes, customs charges, import customs duties, etc.

Transfer is a transaction in which one institutional unit provides a good, a service or an asset to another institutional unit without receiving from the latter any good, service or asset in return as indemnity. Distinction is made between current and capital transfers. They may be either in cash or in kind.

Unallocated share is the gross value added of non-market services provided by the general government sector to the society at large (defence, public administration) and other non-market services financed out of the republican budget; taxes on products payable to the republican budget and subsidies on products receivable from the republican budget of the Republic of Belarus.

## Institutional sectors

An institutional sector is a grouping of institutional units that are homogeneous in terms of their functions in the economy and sources of financing, which implies their similar economic behaviour.

Institutional units are grouped into the following sectors: the non-financial corporations sector, the financial corporations sector, the general government sector, the households sector, and the non-profit institutions serving households sector. The institutional units that are residents of other economies form the rest of the world sector.

The non-financial corporations sector is composed of institutional units whose main function is the production of market goods or non-financial services to be sold on the market and generate profit.

The resources of these units are primarily obtained from sales of goods and services, but some expenses can be subsidized from the budget.

The financial corporations sector consists of institutional units that engage in financial intermediation or in auxiliary financial services on a commercial basis.

Their resources are obtained from the liabilities incurred and interest received, insurance premiums and commission fees.

The general government sector consists of institutional units which provide primarily non-market services (or produce goods) for individual or collective consumption and redistribute income.

Resources of these units are obtained from taxes and contributions payable by institutional units of other sectors as well as from property income.

The household sector consists of all natural persons in an economy, whose main functions are the supply of labour force and final consumption, as well as the production of goods and services for sale and personal use. The institutional unit in the household sector may consist of one or several individuals.

The non-profit institutions serving households sector comprises institutional units that provide non-market services to households (public associations, artistic and trade unions, religious organizations, charity foundations; detached subdivisions of legal entities with a separate balance sheet that provide education, health care and cultural services).

The main source of funds of these units is membership fees and organizations' funds.

## Valuation principles

Economic transactions in the SNA are recorded on an accrual basis at current market prices.

Market price is the end-buyer price paid by purchaser for the delivery of a unit of a good or service. It includes any trade and transport costs and taxes on products (except deductible value-added tax) less subsidies on products.

In order to eliminate the effects of various tax and subsidy rates on the structure of production and generation of income, the GVA by economic activities is estimated at basic prices.

Basic price is the price receivable by producer for a unit of a good or service less any taxes on products, and plus subsidies on products.

In the SNA methodology, the intermediate consumption and changes in inventories are valued net of holding gains (losses) receivable by asset owner as a result of price changes due to inflation. Under the conditions of inflation holding gains (losses) can be rather substantial.

Revaluation at constant prices is made both for GDP produced and for its uses. Prices of the previous year are used as constant prices. Revaluation of the indicators of produced GDP at constant prices is made with a double deflation method where the GVA at constant prices is derived as the difference between the output and intermediate consumption valued at constant prices.

Revaluation of the output and intermediate consumption at constant prices is made with two methods:

- deflating data at current prices for the accounting period for a specific economic activity with corresponding price indices.
- extrapolating data at current prices for the base year for a specific economic activity with volume indices or physical indicators reflecting adequately the trends in this economic activity.

The GDP (GRP) deflator is the price index of all final goods and services the value of which is included in the GDP of a country (region). It is a ratio of the nominal GDP (GRP) at market prices of the current year to the real GDP (GRP) at prices of the base year.

The statistical discrepancy between the GDP produced and GDP consumed shows the discrepancy between the GDP values calculated with different methods: as a sum of GVA of economic activities, and as a sum of final consumption expenditure, gross capital formation and net exports of goods and services.

## International comparisons of gross domestic product

The International Comparison Program (ICP) of gross domestic product provides comparable prices and quantitative measures across different countries by components of GDP use.

The Republic of Belarus takes part in the International Comparison Program on a regular basis since 1993 (ICP rounds of 1993, 1996, 2000, 2005, 2008, 2011, 2014, 2017 and 2021).

The international comparisons of GDP require that the following three conditions are met:

- the economic substance of GDP must be unified for the countries;
- GDP must be expressed in the same currency;
- prices of goods and services must be comparable.

The national GDP estimates of the countries participating in the international comparisons meet the first requirement. However, these estimates do not meet the second and/ or the third requirement because they are expressed in national currencies and are calculated on the basis of national prices. These two latter requirements are met by using purchasing power parities (PPPs).

The purchasing power parity represents a number of currency units needed to buy a standard set of goods and services which can be purchased for one currency unit of the reference country (or for one unit of currency common to a group of countries). PPPs are used for recalculation of value indicators expressed in national currency, such as household final consumption expenditure, main GDP components or GDP, into a single currency.

As the comparison results can be normally obtained not earlier than three years after the ICP round, in compliance with the international practice the interim PPPs of the national currency at the level of GDP in the years between rounds are computed using the global extrapolation method. Herewith, the PPPs of the base ICP year remain the same. The time series of GDP at purchasing power parity are updated continuously to take account of the latest changes in data and are also revised when the results of the next ICP round are released, which complies with the international practice.
