## FOREWORD

The statistical book contains main indicators characterizing the agricultural sector of the Republic of Belarus for 2005-2012. Selected data are given for longer period of time.

The statistical book is prepared on the basis of data of overall and sampling state statistical observations, and also of administrative data.

The statistical book includes data on main indicators of agricultural development: agricultural production, production structure of main agricultural products, per capita agricultural production etc.

The substantial place is given to plant-growing and animal husbandry indicators. This publication includes data on agricultural area and its structure by types of farms; area under crops, gross harvest, yield capacity of agricultural crops and perennial plantations. There are also included data on the number of livestock and poultry, production of main animal husbandry products and other data.

Special part of the publication includes information on agricultural facilities, which covers data on production, availability and supply of agricultural machinery.

There are also data on production of basic products of food industry, foreign trade in food goods, consumption of basic food products and other.

The book also includes data characterizing financial results of organisations, average prices of agricultural products sold.

The data are presented at the national and regional levels with selected indicators broken down by district.

In several cases the 2012 data are preliminary and are subject to revision in further issues.

### Explanation of symbols:

- not applicable
- ... data not available
- 0,0 negligible magnitude

In several cases insignificant discrepancies between the total and the sum of data is to be assigned to data rounding.

Relative ratios are calculated on the basis of absolute figures expressed in smaller units than those given in tables.

## 1. THE MOST IMPORTANT SOCIO-ECONOMIC INDICATORS FOR YEARS 2005-2012

Current estimates of **population size** as of January 1, are calculated taking into account results of 2009 Population Census plus number of births and arrivals in a given territory, minus deaths and departures from this territory. Computing takes into account increase or decrease of population size of selected areas due to their boundaries' changes, as well as changes of urban and rural population size caused by changes in administrative and territorial system of the Republic of Belarus i.e. change of settlement status (rural-to-urban and urban-to-rural transformation under legislative acts).

Computing of population size is conducted for resident population. **Resident population** refers to individuals who permanently reside on a given territory as well as foreigners and stateless persons who temporary reside on a given territory for more than a year.

Distribution of population into urban and rural one is based on the place of residence. In this respect urban settlements are settlements that were granted an urban status under the statutory order (cities, towns, urban-type settlements, workers settlements and health resort areas). All other settlements refer to rural ones.

**Payroll number of employees** includes employees working under the employment agreement (contract) and perform permanent, temporary or seasonal work. The number includes both actually working employees and temporary out of work for any reason (being on a leave, being on a leave on employer's initiative, staying away from work for the reason of being temporary disabled and for other reasons). External multiple job holders and nationals working under the commercial contract are not included into the payroll number.

Average annual payroll number of employees excludes employees being on maternity leave, on a leave connected with the adoption of a child under 3 months of age and being on a leave to care for a child up to the age of three years.

**Nominal gross average monthly wages** of the employees are calculated through dividing gross wage fund including income tax and compulsory insurance contributions of employees by the average payroll number of employees and by the number of months in the period.

**Gross Domestic Product (GDP)** characterizes the value of goods and services produced in the country by kinds of economic activity for final consumption, savings and net exports. GDP by production method is calculated as the sum of gross value added of all kinds of economic activities and net taxes on products (taxes on products less subsidies on products). Gross value added is calculated at the level of economic activity as the difference between the value of goods and services produced (output) and the value of goods and services, fully consumed in the process of production (intermediate consumption).

**Gross Regional Product (GRP)** is a regional analogue of the gross domestic product of the Republic of Belarus, calculated by production method.

Methodological principles of calculation of GRP and its components are similar to the principles of determining these indicators at national level.

**Investments in fixed capital** cover total costs invested in acquisition, reproduction and creation of new fixed assets (costs of building, reconstruction, modernisation, restoration of projects resulting in the increase of the initial value of projects; acquisition of machinery, equipment, transport vehicles; costs of planting and cultivation of perennial plantations; costs of formation of main herd).

## 4. MAIN INDICATORS OF AGRICULTURE

**Agricultural production** is the total value of material benefits and services produced within the branch both for sales and internal consumption. Agricultural production include the value of animal husbandry and plant-growing products, value dynamics of work-in-progress in plant-growing.

**Plant-growing production** is the value of raw foods obtained from the harvest of the reference year (grains and legumes, flax, sugar beet, oil seeds, essential oil seeds, medicinal crops, potatoes, vegetables, fruits and berries, fodder crops (fodder roots, cultivated annual and perennial grasses harvested for hay, green pulp and silage) seeds, planting material (nursery plants), flower products, mushrooms and wild-growing products), expenses related to growing young perennial plantations, changes in value of work-in-progress in plant-growing, (costs associated with work done in reference year for the harvest of the next year (sowing of winter crops, fall-ploughing and other work).

**Animal husbandry production** is the value of raw foods obtained as a result of raising and economic use of farm animals and poultry (milk, eggs, honey, wool etc.), expenses related to raising of farm animals and poultry (offspring, growth and weight gain), the value of young stock sold for breeding aims.

**Index of agricultural output** is a relative ratio reflecting changes in the volume of agricultural production of the periods compared (in constant prices).

**Farms of all types** – are all groups of agricultural producers. They include:

agricultural organisations defined as organisations engaged in agriculture activity (legal persons (except private (peasant) farms), separate subdivisions of legal persons with separate balance with agriculture as the main and (or) secondary activity (in accordance with the National Classification of the Republic of Belarus OKRB 005-2006 "Types of Economic Activities", approved by the resolution of the State Committee for standardization of the Republic of Belarus on December 28, 2006 № 65 «On approval, establishment, modification and cancellation of technical regulations in the field of rate settling and standardization and National Classifier of the Republic of Belarus»), a group 011 "Plant-growing", 012 "Animal husbandry", 013 " Plant-growing combined with animal husbandry (mixed farming)");

private (peasant) farms;

subsidiary household plots include personal subsidiary plots of individuals who permanently reside in rural localities; personal subsidiary plots of individuals who temporary reside in rural localities and subsidiary plots of individuals, engaged in agriculture production using land plots provided for construction and (or) maintenance of residential houses, collective gardening, cottage building.

## 5. RESOURCE AND TECHNICAL BASIS OF AGRICULTURE

**Provision** of agricultural organisations **with tractors** is a ratio of the number of tractors as of end of the year to the arable land area.

**Provision** of agricultural organisations **with selected agricultural machinery** is a ratio of the number of corresponding machinery as of end of the year to the sown area of corresponding crops.

**Agricultural machinery workload** is a ratio of arable or sown area of agricultural crops to the number of machinery.

**Power capacity** is total power capacity of mechanical and electric motors as well as workstock in terms of mechanical power. For tractors, harvesters and vehicles power capacity is defined as the number of motors of every type multiplied by the nominal power capacity thereof.

**Power availability per worker** is a ratio of power capacity to average annual number of workers engaged in agricultural production.

**Provision of power** – ratio of power capacity to sown area of agricultural crops.

**Fixed assets** are defined as part of the national wealth produced in the process of production that is used repeatedly or continuously for production of goods and providing services, transferring gradually its value. The cost of fixed assets include revaluation. Changes in their volume are given in constant prices.

**Investments in fixed capital** cover total costs invested in acquisition, reproduction and creation of new fixed assets (costs of building, reconstruction, modernisation, restoration of projects resulting in the increase of the initial value of projects; acquisition of machinery, equipment, transport vehicles; costs of planting and cultivation of perennial plantations; costs of formation of main herd).

## 6. PLANT-GROWING

**Agricultural land** refers to land plots systematically used to obtain agricultural products. These include arable land, land under permanent crops, meadow land, and fallow lands.

**Arable land** – agricultural systematically cultivated (plowed) land area to be used under agricultural crops including perennial grasses with period of use provided by scheme of crop rotation as well as emergency field, covered ground areas (forcing frames, hothouses, greenhouses) and clean fallow.

**Sown area** is a part of arable land under agricultural crops.

**Gross harvest** of agricultural crops is the volume of (actually harvested) production obtained from the total sown area under agricultural crops. Gross harvest of potatoes, sugar beet, flax, vegetables, root crops and other agricultural crops is shown in initially recorded (gross) weight, and weight after treatment for grain crops.

**Yield capacity** of agricultural crops characterizes average harvest of agricultural products per unit of actually harvested area (per hectare).

## 7. ANIMAL HUSBANDRY

**Number of livestock and poultry** – number of farm animals: cattle, pigs, sheep, goats, horses and others as well as poultry of all types.

**Sales of livestock and poultry** for slaughter (live weight) - sales of all types of livestock and poultry for slaughter through various distribution channels: meat processing organisations and refrigerating plants, subsidiary production units of organisations, consumers' cooperatives, distributed or sold through public catering, sold in the markets and through other distribution channels.

**Milk production** - actually obtained milk including milk consumed in the farms for their own needs. Milk suckled by calves under sucking keeping is not included in milk production.

**Average milk yield** per cow is calculated as a ratio of gross milk yield for the reference period to the average cow population of the dairy herd over the corresponding period.

**Egg production** covers eggs gathered from all kinds of farm poultry, including eggs used for poultry reproduction (incubation), production of egg powder and others as well as loss of eggs (breakage, spoiling etc.)

## 8. FINANCIAL STANDING AND PRICES

Financial indicators are provided on agricultural organisations. Tables 8.1-8.2 include small business and private (peasant) farms.

**Net profit or net loss (final financial result)** is the total amount of financial results from all activities, operating and non-operating incomes less the expenses, and also less taxes and dues, payments and expenses payable from profit.

**Profitability of products, goods, works, and services sold** is calculated as a ratio of profit from sales of goods, products, works, and services to the cost of goods, products, works, and services sold. When the financial result from sales of goods, products, works, and services is negative, then unprofitability takes place.

**Loss-making organisation is an organisation having net loss over the reference period.**

**Profit-making organisation** is an organisation having net profit over the reference period.

**Accounts payable** are obligations to suppliers and contractors for tangible assets received, works done and services provided; on advance payments received; with affiliated organisations, with personnel on wage payments, with budget and extrabudgetary funds, and other creditors.

**Accounts receivable** are debts of customers for goods, works and services; on bills of exchange received; with affiliated organisations, budget, personnel, and other debtors (including debts of dependent entities, advance payments granted to suppliers and contractors, and debts of other debtors).

**Overdue indebtedness** is referred to as debts that have not been repaid in term limit established by contracts and legislative acts.

**Agricultural producer price indices** reflects dynamics of prices on agricultural products sold in the domestic market, which is produced by the organisations of the Republic excluding value added tax, the cost of transportation, loading and uploading of goods but including bonuses and discounts for quality.

Organisations who are the main producers of agricultural products occupying a significant share in the sale of agricultural products with specialization of certain direction are included in the sample of reference organisations in agriculture.

At present the sample includes about 800 organisations. Sample state statistical observation of agricultural producer prices is established on more than 4000 different products.

**Price parity index for industrial and agricultural products** (price parity index for industrial products, works and services consumed by the agricultural organisations, and sold agricultural products) - reflects the ratio between the dynamics of prices on goods and services consumed in agricultural production, and prices on sold agricultural products, and is used for the analysis of the trade terms and pricing adjustments in agriculture.

## 9. PROCESSING OF AGRICULTURAL PRODUCTS

**Volume of industrial production** is a set of finished and semi-finished goods, work performed, services rendered which are classified by the National Classifier of Economic Activities in mining, manufacturing industry, production and distribution of electricity, gas and water.

Data on the volume of industrial production are provided in effective at relevant year transfer prices excluding value added tax, excise duties and other taxes and payments of revenue, including the cost of raw (unpaid) materials. Raw materials are materials that belongs to the customer and transmitted to the industrial processing of other organisations for the production of products in accordance with the existing agreements.

The volume of industrial production is determined without the cost of intrafactory turnover. Intrafactory turnover - the cost of that part of manufactured by the organisation finished and semi-finished products, which are used within the organisation for own production needs and the cost of which is subsequently measured as a part of the expenses included in the cost of the final industrial products.

Data on the volume of industrial production for the industry as a whole by economic activity are given in terms of value as the amount of data on the volume of industrial production of legal entities (including small and micro organisations) and their separate units, regardless of ownership, engaged in the production of goods (works, services) in mining, manufacturing industry, production and distribution of electricity, gas and water.

**Industrial production index** is a relative measure of the change in the number of products produced in comparable periods.

Since 2006, industrial production index is calculated on the basis of the dynamics of the representative goods production and is based on the calculation of individual indices of production of specific industrial products, with further aggregation of individual indices into production indices by economic activity and by the whole industry. Average annual prices of the base year are used for the calculations. The structure of gross value added by kinds of economic activity for the base year is used as weights.

**Industrial production in physical terms** is generally measured by gross output of products, i.e. including products used for own industrial needs within the enterprise. Production volume includes products both from own and supplied by customer raw materials.

## 11. BALANCE OF FOOD RESOURCES

The section comprises balance of food resources of selected agricultural produce and per capita consumption of basic foodstuffs.

**Balance of food resources** is a system of statistical indicators that characterises sources of resource formation for main agricultural produce and its use. The balance demonstrates the flow of agricultural produce from its production till final use. It also allows to conduct current analysis of correlation of resources and their use, as well as forecast of dynamics of situation on the food market.

**The level of self-sufficiency in basic agricultural products** reflects the extent to which own production of the country is able to meet all the needs of the country and is determined as the percentage of the volume of production in the Republic to domestic consumption. Domestic consumption includes: personal consumption fund, the volume of industrial consumption and industrial processing for non-food purposes, the loss of production.
